

NetFlow Control

Transform network flow telemetry into actionable operational intelligence. Visualize live telemetry, detect anomalies, investigate security threats, and drill into raw session detail — all from a single operational console.

NetFlow is Everywhere. Intelligence is Not.

Why traditional NetFlow stops short – and why Ceeview does not.

Traditional NetFlow tools collect and export raw telemetry.

Ceeview transforms flow data into contextual intelligence — enabling enterprises and service providers to observe, correlate, investigate performance issues, and detect potential security threats without leaving the interface.

As part of the Ceeview Intelligent Observability Platform, NetFlow Control transforms network telemetry into actionable operational insight.

NetFlow Intelligence at Enterprise Scale

- High-volume NetFlow ingestion with real-time analysis
- Session-level drilldown for rapid investigation
- Correlated service and infrastructure visibility
- Geographic traffic intelligence and external dependency insight
- Behavioral anomaly detection to identify suspicious traffic activity
- Unified investigation workflow within the Ceeview platform

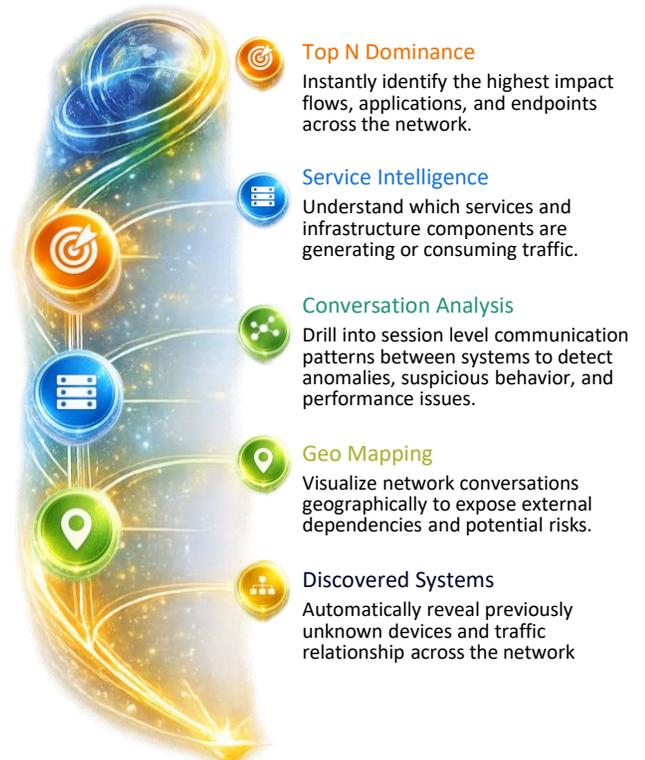

“I’ve used a lot of NetFlow tools over the years, and I’ve never seen one deliver this level of granular, usable, actionable data this quickly. Ceeview went deep into the data and made it truly visible and usable — it’s heads and shoulders above most NetFlow products on the market today.

– Unnar Thor Gardarsson, CEO, ConnectOn

NetFlow Intelligence Functions

Turning raw network flow data into operational insight.

Inside Ceeview NetFlow Intelligence

SEE → PIVOT → CORRELATE → ACT

From Flow Telemetry to Operational and Security Intelligence

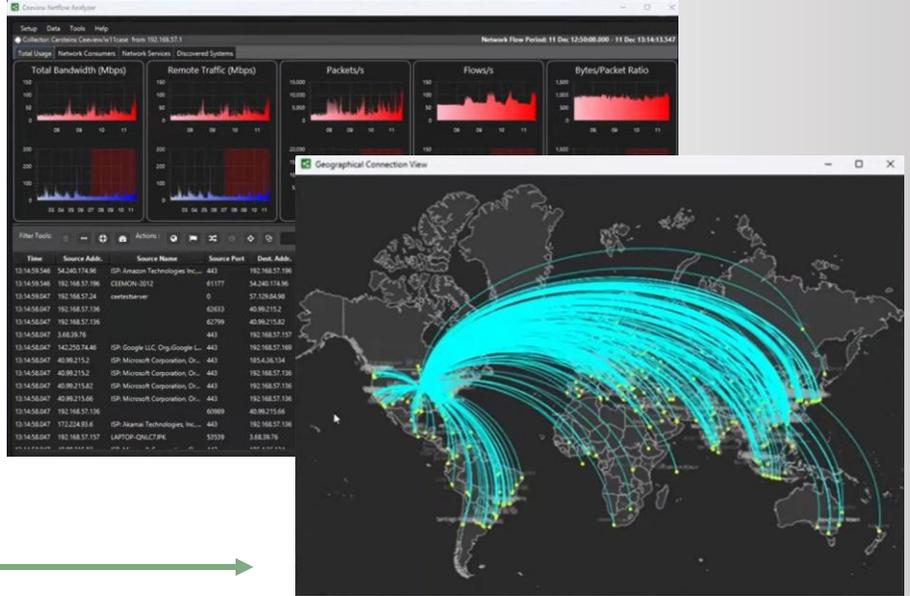

SEE

Live Network Situational Awareness

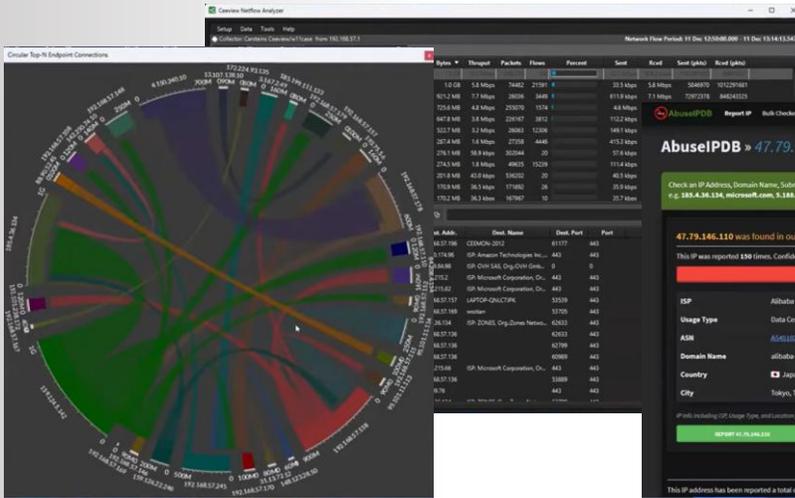

Stay ahead of the curve with instant, real-time visibility into network activity. Investigate directly from a single, unified interface.

Instant Global Traffic Context

See global external traffic paths immediately. Filter, refine, and analyze – no need for exports or separate dashboards.

PIVOT

CORRELATE

Identify Dominant Network Consumers

Rank traffic consumers instantly and expose their internal and external relationships.

From Flow Data to Validated Security Threats

Uncover behavioral anomalies and validate threats with inline intelligence. No pivoting, no time wasted.

ACT

Analyze Services Across the Network

Filter by protocol or port to isolate service traffic. Visualize origin and termination across internal and external networks.
